

## Datasheet 8335

- ✓ Low cost
- ✓ Easy operation

The oil/gas separator model 8335 is used for oil-free testing and calibration of pneumatic instruments when using a hydraulic pressure source, such as a hydraulic deadweight tester. This separator has no diaphragm between the two media and therefore does not affect the accuracy of measurement. The level of separation can be checked through the monitoring glasses.

### Operation

The oil/gas separator model 8335 is used in combination with an external gas pressure source and a gas pressure control unit. This gas pressure control unit is also available from Tradinco, as part of the Tradinco separator model 2255. Please refer to the model 2255 for further information.

### About Tradinco Instruments

Tradinco Instruments provides the best solution for every test, measurement and calibration challenge in the industry.

Our brand promises:

- ✓ Skilled specialists
- ✓ Customer focus
- ✓ Broad portfolio
- ✓ Long-term partnership
